

MLCC & Tantalum Interchangeability Brochure

PRODUCT SELECTION

TANTALUM
AVX is the number one tantalum capacitor supplier with manufacturing plants worldwide meeting quality demands for automotive, aerospace and other high-reliability applications. In fact, solid tantalum capacitors including the newly introduced case size tantalum chip, sharing common footprints with Hi CV MLCC.

POLYMER
AVX offers a broad range of conductive polymer solid electrolyte capacitors featuring high performance with low ESR in standard and low profile case sizes. With design failure mode analysis recommendations, they are a preferred choice in MLCC replacement applications.

NIOBIUM OXIDE
AVX OriCap™ capacitors are solid electrolyte capacitors using Niobium Oxide (NbO) instead of tantalum. Niobium is a widely available material and has several advantages over tantalum including a non-etch circuit failure mode. AVX OriCap™ is available with low ESR, Hi CV and small, low profile case sizes for Hi CV MLCC replacement.

COMMON FOOTPRINTS

IPC has set a standard of recommended footprints for most resistors, capacitors and inductors. Although many companies develop their own internal footprint standards, IPC standards for MLCC and tantalum chip are the starting point.

MLCC & TANTALUM INTERCHANGEABILITY

SURFACE MOUNT DEVICE CAPACITORS - FOOTPRINT COMPATIBILITY:
Tantalum chip and Hi CV MLCC have a large degree of overlap in available capacitance ratings in common footprints. As MLCC production increased, many applications converted from tantalum to MLCC for many filtering, bypass, and hold-up applications. With the increasing demands seen for low voltage digital applications, tantalum electrolytic technologies have become a first choice for MLCC substitution.

PRODUCT SELECTION

COMMON FOOTPRINTS

TANTALUM

AVX is the number one tantalum capacitor supplier with manufacturing plants worldwide providing flexibility and capacity for all electronic industry demands. We are the global leader in MnO₂ solid tantalum technology, including the world's smallest case size tantalum chips, sharing common footprints with Hi CV MLCC.

POLYMER

AVX offers a broad range of conductive polymer solid electrolytic capacitors featuring high capacitance with low ESR in standard and low profile case sizes. With a benign failure mode under recommended usage conditions, they are a good choice in MLCC replacement applications.

NIOBIUM OXIDE

AVX OxiCap® capacitors are solid electrolytic capacitors using Niobium Oxide (NbO) anode material instead of traditional Tantalum. Niobium is a widely available material and has several advantages over tantalum including a non-short circuit failure mode. AVX OxiCap® is available with low ESR, Hi CV, and small, low profile case sizes for Hi CV MLCC replacement.

AVX ELECTROLYTIC ADVANTAGES

AVX is a leading international manufacturer and supplier of a wide range of advanced electronic components, including: capacitors, inductors, filters, and circuit protection devices.

The AVX tantalum electrolytic division has maintained a leadership position in automotive, industrial, medical, space, military, consumer electronics, communications, and transportation markets for nearly 50 years.

Component: IPC-782-8-2-2

Footprint: IPC-782-8-2-3

IPC has set a standard of recommended footprints for most classes of surface mount electronic components including resistors, capacitors and inductors.

Although many companies develop their own internal footprint guidelines, IPC standards for MLCC and tantalum chip are the starting point.

DESIGN PARAMETER

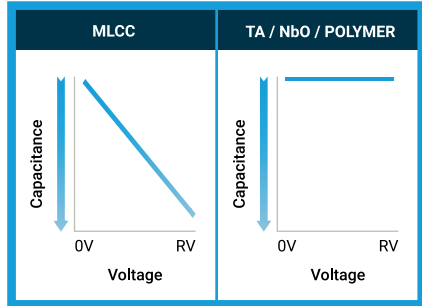

Maximum Available Capacitance by Case Size (6.3V):

µF	0402	0603	0805	1206	1210
Tantalum	22	100	100	220	220
Polymer	4.7	47	100	100	330
NbO	-	-	22	47	100

TECH COMPARISON

Voltage Coefficient:

The capacitance of a Hi CV MLCC will decrease as bias voltage increases. Tantalum, polymer, and niobium oxide show no voltage coefficient effect.

Temperature Coefficient:

The capacitance of a Hi CV MLCC will decrease at both high and low temperatures. Tantalum, polymer, and niobium oxide show no voltage coefficient effect.

Reverse Bias / Non-Polar Operation:

For non-polar operation, connect two electrolytic capacitors in series back-to-back (typically common negative). Two identical capacitors in series will have half the capacitance of a single capacitor, the same voltage rating, but will now be bidirectional (non-polar).

SPECIFICATION COMPARISON

ATTRIBUTES	MLCC		TANTALUM CHIP		POLYMER CHIP		NbO CHIP OxiCap®

Piezo Noise	@ Audio Frequencies	@ Audio Frequencies						
Reverse Voltage			Not Allowed					
To Be Considered	Parametric Stability vs DC Bias, Ripple & Temperature		Derating Rules		Check for MLS		Max Rated Voltage 10V	

ESR (Equivalent Series Resistance):

The impedance curve of a Hi CV MLCC has a high Q (sharp resonance) and very low ESR.

The impedance curve of tantalum and niobium electrolytic capacitors has a broadband characteristic with low ESR, which increases at low temperatures.

The impedance curve of polymer electrolytic capacitors also has a broadband characteristic, but with lower ESR than tantalum and niobium oxide electrolytics, and remains low at low temperatures.
